Abstract

Acyclic nucleoside phosphonates (ANPs) are nowadays one of the key drugs in the treatment of DNA virus and retrovirus infections. In this work, we report the synthesis and antiviral evaluation of phosphonoamidate and diamidates prodrugs of C5-pyrimidine acyclic nucleosides derivatives functionalized with but-2-enyl-chain. In the phosphonoamidate series, the most active compound 15, showed sub-micromolar activity against varicella zoster virus (VZV) (EC50 =0.09-0.5 µM) and µM activity against human cytomegalovirus (HCMV) and herpes simplex virus (HSV). Separation of single diastereoisomers for compound 14, showed that 14b had better anti-herpesvirus activity and no cytotoxicity compared to the diastereoisomeric mixture 14. Very interestingly, phosphonodiamidate 21 showed anti-herpesvirus activity with excellent activity against wild type and thymidine kinase-deficient (TK-) VZV strains (EC50 = 0.47 and 0.2 µM, respectively) and HCMV (EC50 = 3.5-7.2 µM) without any cytotoxicity (CC50 >100).

Keywords: Phosphonoamidate; HCMV; C5-pyrimidine acyclic nucleosides; VZV
1. Introduction

Acyclic nucleoside phosphonates (ANPs), nucleotide analogues with a stable P−C bond, are the cornerstone of antiviral therapy (De Clercq and Holy, 2005; De Clercq et al., 1987; Pertusati et al., 2012). Three ANP analogues; cidofovir (1, CDV, Vistide)(De Clercq et al., 1987) adefovir dipivoxil (2, bis-POM PMEA, Hepsera)(Clercq et al., 1986), tenofovir disoproxil (3, TDF, Viread)(Balzarini et al., 1993), were the first ANPs approved for the treatment of severe viral infections (Figure 1). More recently, Tenofovir alafenamide (formerly GS-7340), a phosphoroamidate prodrug of Tenofovir, was developed by Gilead Sciences to treat HIV infection and chronic hepatitis B (Callebaut et al., 2015). In November 2015, the FDA approved its use in the form of tenofovir alafenamide fumarate (4, TAF) for HIV therapy (http://www.gilead.com/news/press-releases/2015/11/us-food-and-drug-administration-approves-gileads-single-tablet-regimen-genvoya-elvitegravir-cobicistat-emtricitabine-and-tenofovir-alafenamide-for-treatment-of-hiv1-infection).

Figure 1. ANPs in the market (1-4) and the novel ANPs reported by Agrofoglio (5-6).

The activities of ANPs are based on the intracellular phosphorylation by two salvage pathway kinases (nucleoside monophosphate [NMP] and nucleoside diphosphate [NDP] kinases) to their diphosphates (ANP-PPs). ANP-PPs mimic the
natural nucleoside triphosphates and are the active form capable of inhibiting the viral DNA polymerases. (De Clercq, 2007; Pertusati et al., 2012)

Since the structure of the ANPs side chain strongly influences their antiviral selectivity, several series of compounds, modified in their acyclic moiety, have been reported. Among them, of particular interest to this project are ANPs analogues with a more rigid acyclic chain. The increased rigidity was achieved by the introduction of a double bond. This structural feature has been found to be important and effective for the antiviral activity of these class of unsaturated ANPs (Stella et al., 2014).

The introduction of an ethenyl unit into the acyclic side chain allows the ANPs to better mimic the conformation of the ribose ring. In addition, because a double bond has an appreciable electron-withdrawing effect, it maintains an electronic contribution similar to the oxygen atom (Hansch and Leo, 1979). This last feature assures that the important second dissociation constant of alkenyl-phosphonic acids can closely mirror those of the natural phosphate.

Surprisingly, almost all biologically active ANP are purine derivative. The only pyrimidine based ANP in the market is Cidofovir. In order to identify novel and more potent ANPs, Agrofoglio’s group reported the synthesis of several pyrimidine ANPs in which the oxygen heteroatom has been replaced with a double bond having a trans stereochemistry (Oh et al., 2005), (Amblard et al., 2005a), (Amblard et al., 2005b), (Topalis et al., 2011) (McGuigan et al., 2013a).

Among the different ANPs synthesised, compounds 5 and 6 proved to be efficient substrates for the human thymidine monophosphate kinase with their bis-POM prodrugs 7 and 8 (Figure 1) showing remarkable antiviral activity. Compound 7 for example was particularly active against HSV-1 and HSV-2 (EC_{50} = 3.1 and 6.1
µM, respectively) and against TK+ and TK- VZV strains (EC50 = 0.41 and 0.19 µM, respectively) but not against HCMV (Topalis et al., 2011).

To the best of our knowledge, no other prodrug approach other than bis-POM has been applied to these interesting pyrimidine scaffolds. In search for more potent ANPs, together with a better safety profile, we were interested in study the impact, of the phosphonoamidate and phosphonodiamidate prodrugs on the antiviral activity of ANPs 5 and 6 and compare their antiviral activities with those of the bis-POM derivatives (Topalis et al., 2011). We were also interested in assessing the antiviral activity of the novel compounds against HSV and VZV TK+ and TK- strains to prove that our prodrugs are able to bypass the first phosphorylation step.

Our group also obtained excellent results using the phosphoroamidate approach on adefovir and tenofovir (Pertusati et al., 2014a) as well as on anticancer nucleosides (NUC-1031, phase 3 clinical trial for solid tumours and NUC-3373 among others http://www.nucanabiomed.com/products.html).

2. Materials and methods
2.1 Experimental chemistry

All anhydrous solvents were purchased from Sigma–Aldrich, NMR solvents from Cambridge isotope laboratories and reactants from Acros Organics, Sigma Aldrich, Alfa Aesar, Fluka, Carbosynth and Molekula. All reagents commercially available were used without further purification. Analytical Thin Layer Chromatography (TLC): pre-coated aluminium backed plates (60 F254, 0.2 mm thickness, Merck) were visualized under 254 nm UV light or using KMnO4. Preparative TLC was performed with Analtech blanket 2000, 1000 or 500 m silica gel GF. Flash column chromatography was carried out using silica gel supplied by Fisher (60A, 35–70 mm) or with Biotage Isolera One purification system. Analytical High Performance Liquid Chromatography (HPLC) analysis was performed using both Spectra System SCM (with X-select-C18, 5 µm, 4.8x150 mm column) and Varian Prostar system (LC Workstation-Variant Prostar 335 LC detector). Preparative HPLC was performed with Varian Prostar (with pursuit XRs C18 150 x 21.2 mm column). $^1$H NMR (500 MHz), $^{13}$C NMR (125 MHz), and $^{31}$P NMR (202 MHz) spectra were recorded on a Bruker Avance 500 MHz spectrometer at 25 °C. Chemical shifts (δ) are quoted in parts per million (ppm) relative to internal MeOD (δ=3.34 $^1$H-NMR, δ=49.86 $^{13}$C-NMR) and CDCl$_3$ (δ=7.26 $^1$H-NMR, δ=77.36 $^{13}$C-NMR) or external 85% H$_3$PO$_4$ (δ=0.00 31P-NMR). Coupling constants (J) are given in Hertz. The following abbreviations are used in the assignment of NMR signals: s (singlet), d (doublet), t (triplet), q (quartet), qn (quintet), m (multiplet), bs (broad singlet), dd (doublet of doublet), dt (doublet of triplet). Low resolution mass spectrometry was performed on a Bruker Daltonics microTOF-LC system, and as a service by the School of Chemistry at Cardiff University. Compounds 5, 6, 11 and 12 were
prepared following literature procedures and their $^1$H, $^{31}$P and $^{13}$CNMR were in accordance with the literature.9

2.1.1 General procedure for preparation of phosphoroamidates prodrugs (13-20)

phosphonodiamidate (21-23)

In a round bottom flask, under an argon atmosphere, the appropriate diester (11 or 12) was dissolved in dry acetonitrile (ACN) and treated with an excess of TMSBr (5 equivalents). The mixture was then stirred overnight at room temperature and then the volatiles evaporated without any contact with air. Then, the flask was charged with the appropriate, dry amino acid ester 4- toluene sulfonate salt (1 equivalents with respect to the 11 or 12), and the solids dissolved in a mixture of dry triethylamine and dry pyridine (1:4 v/v) and heated to 50°C to obtain a homogenous solution. To this, it was added a solution of 2,2-dithiodipyridine (5 equivalents) and triphenylphosphine (5 equivalents) in dry pyridine, prepared in a separate flask, under an argon atmosphere. The resulting mixture was stirred at 50°C for 3-4 hours, to reach the complete conversion as monitored by TLC (DCM/MeOH 95:5 v/v). After evaporating all the volatiles, the residue was treated with a mixture of methanol, water, hexane and toluene (1:1:1:1) and transferred into a separatory funnel. The upper layer (Hexane/toluene) was separated and the aqueous (MeOH/water) extracted 3 times with a mixture of toluene/hexane (1:1). The water/methanol layer was further extracted with DCM (20 mL x 3). The organics were dried over MgSO$_4$, filtered and evaporated. The residue was purified with flash column chromatography on silica gel using DCM/MeOH (gradient, usually from 99:1 to
95:5 v/v) as eluting mixture and then by preparative TLC (95:5 v/v) or
preparative HPLC (gradient ACN/water 10:90, 100% ACN in 30 minutes, 100%
ACN for 5 minutes, then ACN/water 10:90 in 2 minutes).

2.2 Biological assays

The compounds were evaluated against the following viruses: herpes simplex
virus type 1 (HSV-1) strain KOS, thymidine kinase-deficient (TK−) HSV-1 KOS
strain resistant to ACV (ACVr), herpes simplex virus type 2 (HSV-2) strains Lyons
and G, varicella-zoster virus (VZV) strain Oka, TK− VZV strain 07−1, human
cytomegalovirus (HCMV) strains AD-169 and Davis, vaccinia virus Lederle strain,
respiratory syncytial virus (RSV) strain Long, vesicular stomatitis virus (VSV),
Coxsackie B4, Parainfluenza 3, Influenza virus A (subtypes H1N1, H3N2),
influenza virus B, Reovirus-1, Sindbis, Reovirus-1 and Punta Toro. The antiviral
assays were based on inhibition of virus-induced cytopathicity or plaque
formation in human embryonic lung (HEL) fibroblasts, African green monkey cells
(Vero), human epithelial cells (HeLa) or Madin-Darby canine kidney cells (MDCK).
Confluent cell cultures in microtiter 96-well plates were inoculated with 100
CCID$_{50}$ of virus (1 CCID$_{50}$ being the virus dose to infect 50% of the cell cultures) or
with 20 plaque forming units (PFU) (VZV) in the presence of varying
concentrations of the test compounds. Viral cytopathicity or plaque formation was
recorded as soon as it reached completion in the control virus-infected cell
cultures that were not treated with the test compounds. Antiviral activity was
expressed as the EC$_{50}$ or compound concentration required to reduce virus-
induced cytopathogenicity or viral plaque formation by 50%.
The cytostatic activity measurements were based on the inhibition of cell growth. HEL cells were seeded at a rate of $5 \times 10^3$ cells/well into 96-well microtiter plates and allowed to proliferate for 24 h. Then, medium containing different concentrations of the test compounds was added. After 3 days of incubation at 37 °C, the cell number was determined with a Coulter counter. The cytostatic concentration was calculated as the $CC_{50}$, or the compound concentration required to reduce cell proliferation by 50% relative to the number of cells in the untreated controls. $CC_{50}$ values were estimated from graphic plots of the number of cells (percentage of control) as a function of the concentration of the test compounds. Alternatively, cytotoxicity of the test compounds was expressed as the minimum cytotoxic concentration (MCC) or the compound concentration that caused a microscopically detectable alteration of cell morphology.

3. Results and discussion

3.1 Chemistry

Our research began with the synthesis of the alkenyl-functionalized pyrimidine methyl phosphonates 11 and 12. The general strategy for the convenient stereo-controlled synthesis of these trans-alkene acyclic nucleoside phosphonates from thymine 9 and bromo-uridine 10 (Scheme 1), was based on olefin cross metathesis, developed by Agrofoglio and colleagues. (Topalis et al., 2011) Phosphonic acids 5 and 6 (parent nucleosides) were prepared by treatment of 11 and 12 with an excess of trimethyl bromosilane (TMSBr) followed by aqueous workup (Topalis et al., 2011) (Scheme 1).
Scheme 1: Synthesis of methyl phosphonates 11 and 12 and the parent phosphonic acids 5a and 6.

The synthesis of phosphonoamidate prodrugs of these new ANPs was then attempted beginning with the phosphonate esters 11 and 12 using the one-pot procedure reported by Holy (Jansa et al., 2011) and successfully adapted by us for the synthesis of adefovir and tenofovir phosphonoamidate prodrugs (Pertusati et al., 2014b).

Briefly, methylphosphonates 11 and 12 were converted into the correspondent silyl esters by treatment with an excess of trimethylsilyl bromide (Jansa et al., 2011). The silyl derivatives were then treated with an excess of phenol (4 equivalents) and L-alanine-O-neopentyl ester (4 equivalents), in presence of a mixture of triphenylphosphine (5 equivalents) and 2,2-dipyridyl disulphide, (Aldrithiol, 5 equivalents). Under this protocol, only traces of the desired phosphonoamidate 14 were detected (TLC, Mass spectra, and $^{31}$P-NMR of the crude mixture) with the phosphonodiamidate 21 being the major product. It is clear from these results that the phenol was not nucleophilic enough to compete with the amino acid ester for the replacement of the silyl ester. Indeed, when the more nucleophilic $p$-Methoxy phenol was used as aryl alcohol partner in the above reaction sequence, the desired ProTide 13 was obtained in 18% yield although some diamidate was always isolated. Despite the fact that ProTides bearing para-Methoxy phenol were successfully applied to glucosamine (Serpi et al., 2012), this aryl moiety might be activated too slowly compared to the unsubstituted aryl prodrugs (Derudas et al., 2009). To circumvent this potential problem, we envisaged that increasing the concentration of phenol would allow us to obtain a better yield of the desired ProTide. After several attempts, we found that addition of an excess (6 equivalents) of phenol with respect to the L-alanine neopentyl
ester tosilate (1 equivalent) was sufficient to obtain a reasonable yield of phosphonoamidate (Scheme 2).

Scheme 2: Synthesis of phosphonoamidate and phosphonodiamidate prodrugs from esters 11 and 12;
Reagents and conditions: a) TMSBr, CH₃CN, rt, 8h, Argon atm.; b) Amino acid ester hydrochloride or tosylate (1 equiv.), ArOH (6 equiv.), PPh₃ (6 equiv.), Aldrithiol-2 (6 equiv.) NEt₃/Pyridine (1:4 v/v), 50°C, 4-8 hours; See table 1 for Ar and R definitions and yields

However, the phosphonodiamidates were always obtained alongside with the desired products (ProTide: diamidate roughly 1:1, at best). This fact was not completely unwanted since a one-pot reaction gave us two different prodrugs in a fairly reasonable yield. In few cases, with amino acids having bulky esters (L-Ala-O-hexyl, L-valine-O-pentyl ester, L-isoleucine-Opentyl ester), the yields for both products (mono and diamidate) were very low (1-3 %) probably due to steric reasons. In some circumstances, it was possible to accomplish the separation by column chromatography on silica gel of the two phosphonoamidate diastereoisomers. This was achieved with compounds 14 and 20 that were isolated as single isomers 14a and 14b and 20a and 20b (Table 1). Compounds synthesised by this improved procedure are collected in the table 1:

Table 1 Compounds synthesised in this study and relative yields.

When, 5-Bromo uracil derivative 12 was subjected to the reaction conditions of Scheme 2, we were able to isolate a third compound (other than phosphonodiamidate, and ProTide). Analysis by mass spectrometry and ¹H-NMR of this new compound, revealed that the bromine in the nucleobase was replaced with a hydrogen. Indeed, uracil derivative 20 was isolated with a 5% overall yield. We attributed the formation of this derivative to the presence of triphenylphosphine in the reaction medium. Indeed, it has been shown that triphenylphosphine is able to debrominate α-bromo-carbonyl compounds (Borowitz and Grossman, 1962; Hoffmann and Diehr, 1962). To investigate if this was the case, we set up a control experiment consisting in the treatment of a solution of 5-Bromo uracil 24 in a 1:4 mixture of triethylamine and pyridine with
triphenylphosphine at 50°C. Indeed, we observed after 3 hours, the formation of the corresponding uracil 25 isolated in 50% yield (Scheme 2).

Scheme 2: Control experiment for the reduction of 5-bromo-uracil 24 to uracil 25 under the reaction conditions of Scheme 2.

The use of TMSBr in the synthetic sequence was considered responsible for the low yield due to the bromination of the alkenyl chain. The low stability of these brominated derivatives, whose formation was observed by mass spectrometry, did not allow their isolation and characterization. The low yield problem was also exacerbated in the case of the 5-bromouracil derivatives. With these substrates, a further reduction in the yield of the desired prodrugs was due to the action of the triphenyl phosphine, which caused the reduction of the C-Br bond in the nucleobase, leading to the formation of the uracil derivatives. The overall result was a lower yield of the desired compounds.

3.2 Antiviral evaluation

With our phosphonoamidates 13-20 and bis-amidates 21-23 in hand, we proceeded to investigate their biological activities against a variety of DNA viruses. In particular, we were interested in assessing if our prodrugs were able to perform better than the bis-POM prodrugs 7 and 8 (Agrofoglio and co-workers (Topalis et al., 2011), against HSV-1, Kos strain, HSV-2 (G strain), (TK) HSV-1 (Kos acyclovir-resistant strain), VZV wild-type OKA strain, TK- VZV (07/1 strain), HCMV strains AD-169 and Davis, vaccinia virus in HEL cell cultures.
As expected from their high polar nature and from literature data\(^1\), phosphonic acids 5 and 6 resulted totally inactive against all viral strains tested in this study, probably due to their inability to permeate inside the cell.

In the phosphonoamidate family (ProTide), all our prodrugs showed good to moderate activity against both TK\(^+\) and TK\(^-\) VZV strains in HEL cells except for compound 20 (tested both as 1:1 mixture of diastereoisomers and individual isomers, Table 2, entries 14, 15, 16) which showed no activity against HSV and only a moderate activity against VZV. In this case, the diastereomeric mixture was completely inactive, while one of the two single diastereoisomer 20b, was slightly more active than the other 20a.

Compound 15 (the most active in this phosphonoamidate family) proved to have an inhibitory activity against the different HSV-1, HSV-2, VZV and HCMV strains with activity slightly better that the Bis(POM) prodrug 7 in the case of HSV-2 (EC\(_{50}\) = 2.9 vs 6.1 \(\mu\)M) and TK\(^-\) HSV-1 Kos ACV\(^r\); (EC\(_{50}\) = 2.6 vs 9.2 \(\mu\)M). 15 was also less toxic than 7 and 8 and in contrast to the Bis(POM) prodrugs proved active against HCMV. Evaluation of single isomers of 14 showed that the slow eluting isomer (HPLC) 14b, was the most active of the two isomers against HSV, VZV and HCMV (Entry 5 vs. 6) and also the less cytotoxic one (14b EC\(_{50}\) >100 vs 14a EC\(_{50}\) = 19.08). Compound 16 was moderately active against VZV and HSV and inactive against HCMV with a cytotoxicity comparable to 7 (Table 2, Entry 7 vs. 15).

All phosphonoamidate prodrugs having 5-bromouracil as nucleobase were found barely active against HSV, except for 16 that had EC\(_{50}\) values comparable to that of the BIS(POM) prodrug 7 (Table 2; Entries 7-12). Although 16 inhibited VZV replication with EC\(_{50}\) values in the \(\mu\)M range, it completely lost activity against HCMV.
Compounds 17 to 19 showed anti-HSV and anti-VZV activity like that of the corresponding bis-POM prodrug 8 (Table 2, Entries 8-11 vs 16) but in contrast to the latter prodrug they also displayed some anti-HCMV activity. No striking anti-vaccinia virus was observed with any of the prodrugs having 5-bromouracil as nucleobase. In case of compound 17, the 1:1 mixture of diastereoisomers showed the same activity as the single isomers 17b.

Based on our experience (McGuigan et al., 2013b) phosphoro- and phosphonodiamidates are usually less active than the corresponding ProTide, probably due to a slower processing rates considering that an amino acid ester is less easily displaced than an aryl moiety typical of a ProTide. Quite surprisingly, in our study one out of three phosphonodiamidates (21) proved active against herpesviruses in HEL cell cultures. Compound 21, showed interesting activity against HSV-2 G-strain (EC$_{50}$ = 8.1 µM), HSV-1 TK- (Kos ACV$^r$ strain) (EC$_{50}$ = 3.6 µM) and slightly less active against HSV-1 KOS strain (EC$_{50}$ = 13.8 µM), as highlighted in Table 2, Entry 1. This compound had also remarkable activity against TK$^+$ and TK$^-$ VZV strains (EC$_{50}$ = 0.47 and 0.20 µM, respectively) and proved as active as the reference anti-HCMV drug ganciclovir against human CMV. However, this compound was found inactive against HEL cell infected with Vaccinia virus (Table 2, Entry 1).

Replacement of the methyl group in compound 21 by a bromine group gave compound 22 resulting in detrimental effects for the anti-herpesvirus activity (Table 2 Entry 2). As for compound 21, also 22 was found totally inactive against Vaccinia virus (Table 2, Entry 2). The diamidate 23 was found totally inactive against HSV, HCMV and vaccinia virus (Table 2, Entry 3) showing only a very weak activity against VZV strains. Collectively, compound 21 showed better activity
than acyclovir against TK HSV-1 strain (Kos ACVr), but was found less active than cidofovir, acyclovir and ganciclovir against wild-type HSV-1 and HSV-2 strains. Finally, the diamidate 21 showed the same antiviral activity against TK+ and TK- VZV strains than the bis-POM prodrug 7 but lower potency against HSV strains (Table 2, Entries 1 vs Entry 15). Interestingly, its antiviral activity was better than that of the Br-POM prodrug 8 against HSV and VZV except for HSV-1 (Table 2, Entries 1 vs Entry 16). Importantly, while prodrugs 7 and 8 were unable to inhibit HCMV replication at the higher concentration tested (40 µM), the EC50 values for the phosphonodiamidate 21 against HCMV were comparable to those found for the reference anti-HCMV drug ganciclovir. Although prodrugs 7 and 8 were moderately active against Vaccinia virus, our diamidate 13 was inactive. Finally, all our prodrugs were deprived of activity (EC50 > 100 µM) against the different RNA viruses tested.

aEffective concentration required to reduce virus cytopathic effect (HSV, vaccinia virus and CMV) or plaque formation (VZV) by 50%.
bMinimum cytotoxic concentration that causes a microscopically detectable alteration of cell morphology. cConcentration required to reduce cell growth by 50%.

Compound 7: [E]-bis(POM)-TbutP – Compound 8: [E]-bis(POM)-5Br-UbutP
4. Conclusions

In conclusion, we have successfully synthesised a series of phosphonoamidate and diamidates prodrugs of C5-pyrimidine acyclic nucleosides derivatives functionalized with but-2-enyl chain. We were able to demonstrate that the phosphonoamidate approach applied to compound 5 and 6 was capable of turning these inactive parent nucleosides to active antiviral agents.

In the phosphonoamidate series, the most active compound 15, showed sub-micromolar activity against VZV (EC$_{50}$ = 0.09-0.5 µM) and µM activity against HCMV and HSV. Importantly, its activity against both wild type and TK- HSV and VZV strains make it a good candidate for the therapy of acyclovir-resistant viruses due to mutations in the viral thymidine kinase gene. In general, our phosphonoamidates have a comparable, and in some cases, better antiviral activity with respect to the bis-POM derivatives. Very interestingly, our prodrugs were able to inhibit HCMV whereas the bis-POM derivatives 7 and 8 were inactive. Other analogues of these structural motifs with more complex amino acid moieties are under investigation in our laboratory.

Acknowledgments

The authors wish also to express their gratitude to Mrs. Ellen De Waegenaere, Mr. Seppe Kelchtermans, Mrs. Leentje Persoons and Mrs. Lies Van Den Heurck for excellent technical assistance. The virological part of this work was supported by the KU Leuven (GOA no. 10/014).

General procedure and data for target compounds S2-S11

**General procedure for the synthesis of phosphoamidates 13-20 and phosphonodiamidates 21-23.**

In a round bottom flask, under an argon atmosphere, the desired diester (11 or 12) was dissolved in dry acetonitrile (ACN) and treated with an excess of TMSBr (5 equivalents). The mixture was then stirred overnight at room temperature and then the volatiles evaporated without any contact with air. Then the flask was charged with the appropriate, dry amino acid ester p-toluene sulfonate salt (1 equivalents with respect to the 11 or 12), and the solids dissolved in a mixture of dry triethylamine and dry pyridine (1:4 v/v) and heated to 50°C to obtain a homogenous solution. To this, it was added a solution of 2,2-dithiodipyridine (5 equivalents) and triphenylphosphine (5 equivalents) in dry pyridine, prepared in a separate flask, under an argon atmosphere. The resulting mixture was stirred at 50°C for 3-4 hours, to reach the complete conversion as monitored by TLC (DCM/MeOH 95:5 v/v). After evaporating all the volatiles, the residue was treated with a
mixture of MeOH, water, hexane and toluene (1:1:1:1) and transferred into a separatory funnel. The upper layer (hexane/toluene) was separated and the aqueous (MeOH/water) extracted 3 times with a mixture of toluene/hexane (1:1). The water/methanol layer was further extract with DCM (20 mL x 3). The organics were dried over MgSO$_4$, filtered and evaporated. The residue was purified with flash column chromatography on silica gel using DCM/MeOH (gradient, usually from 99:1 to 95:5 v/v) as eluting mixture and then by preparative TLC (95:5 v/v) and/or preparative HPLC (gradient ACN/water 10:90, 100% ACN in 30 minutes).

Compounds 13, 15, 16, 17a and 18 were obtained as diastereomeric mixtures. Where possible, the characteristic parameters of the signals of the two isomers are described separately.

**(2S)-neopentyl-2-(((4-methoxyphenoxy)((E)-4-(5-methyl-2,4-dioxo-3,4-dihydropyrimidin-1(2H)-yl)but-2-en-1-yl) phosphoryl)amino)propanoate (13)**

Compound 13 was prepared according to the general procedure from 11 (200 mg 0.632 mmol, 1 eq.), TMSBr (483 mg, 3.16 mmol, 5 eq.) in dry ACN (10 mL), L-alanine-O-neopentyl ester tosylate (843 mg, 2.52 mmol, 4 eq.) and pMeO-phenol (312 mg, 2.52 mmol, 4 eq.) triphenylphosphine (813 mg, 3.79 mmol, 6 eq.) 2-aldrithiol. (356 mg, 3.79 mmol, 6 eq.). After workup the crude was purified by silica chromatography column using a gradient of DCM/MeOH (99:1 to 95:5 v/v) and providing after preparative TLC (95:5 v/v) 13 (54 mg, 17% yield).$^1$H-NMR (500 MHz, CD$_3$OD) $\delta$H 7.41(1H, d, $J$=1.2 Hz, H-6), 7.39 (1H, d, $J=1.2$ Hz, H-6), 7.12 (3H, dd, $J= 9.0$ and 2.1 Hz, H-Ph,), 6.87 (2H, dd, $J = 9.0$ and 2.1 Hz H-Ph), 5.82-5.76 (4H, m, NCH$_2$C= and =C=CH$_2$P), 4.36-4.24 (4H, m, C$_2$H$_4$N), 3.34-3.33 (4H, m, C$_2$H$_2$CH$_3$), 3.7 (6H, s, OCH$_3$), 3.34-3.33 (4H, m, CH$_2$(CH$_3$)$_3$), 2.87-2.78 (4H, m, CH$_2$P), 1.87 (6H, s, CH$_3$), 1.34 (3H, d, $J= 7.2$ Hz, CHCH$_3$), 1.26 (3H, d, $J = 7.3$ Hz, CHCH$_3$), 0.96 (18H, s, C(CH$_3$)$_3$).$^{13}$C-NMR (125 MHz, CD$_3$OD) $\delta$C: 175.49 (d, $^3$J$_{PC} = 4.9$ Hz, COO), 175.13 (d, $^3$J$_{PC} = 3.7$ Hz, COO), 158.23 (C-4), 166.88 (C-ipso PhOCH$_3$), 150.45 (C-2), 150.38 (d, $^2$J$_{CP} = 9.1$ Hz,
(2S)-neopentyl2-((((E)-4-(5-methyl-2,4-dioxo-3,4-dihydropyrimidin-1(2H)-yl)-but-2-en-1-yl)(phenoxy)phosphoryl)amino) propanoate (14a and 14b) and (2S,2'S)-dineopentyl-2,2'((((E)-4-(5-methyl-2,4-dioxo-3,4-dihydropyrimidin-1(2H)-yl)-but-2-en-1-yl)phosphoryl)bis(azanediyl))dipropanoate (21)

Compound 14a, 14b and 21 were prepared according to the general procedure from 11 (87 mg, 0.275 mmol, 1 eq.), TMSBr (210.6 mg, 1.38 mmol, 5 eq.) in dry ACN (10 mL), L-alanine-O-neopentyl ester tosylate (91.1 mg, 0.275 mmol, 1 eq.) and phenol (432.9 mg, 1.65 mmol, 6 eq.) triphenylphosphine (363.6 mg, 1.65 mmol, 6 eq.) 2-aldithiol. (155.3 mg, 1.65 mmol, 6 eq.). After workup, the crude was purified by silica chromatography column using a gradient of DCM/MeOH (99:1 to 95:5 v/v) and providing preparative TLC (95:5 v/v) 14a (21.6 mg, 16% yield). Rf(DCM/MeOH 95:5 v/v) = 0.32. 1H-NMR (500 MHz, CD3OD) δH 7.41 (1H, d, J = 1.1 Hz, H-6), 7.38-7.34 (2H, m, CH-Ph), 7.21-7.18 (3H, m, CH-Ph), 5.83-5.79 (2H, m, NCH2CH= and CH=CH2P), 4.36 (2H, t, J = 4.8 Hz, CH2N), 7.21-7.18 (3H, m, CH-Ph), 5.83-5.79 (2H, m, NCH2CH= and CH=CH2P), 4.36 (2H, t, J = 4.8 Hz, CH2N), 4.05-3.99 (1H, m, CHCH3), 3.87, 3.77 (2H, AB, JAB = 10.5 Hz, CH2C(CH3)3), 2.87 (2H, ddd, J = 6.4 and 4.6 Hz, JPH = 20.5 Hz, CH2P), 1.87 (3H, d, J = 1.2 Hz, CH3), 1.26 (3H, d, J = 7.3 Hz, CHCH3), 0.96 (9H, s, C(CH3)3) ppm. 31C-NMR (125 MHz, CDCl3) δC 174.05 ((d, 3JPC = 4.9 Hz, COO), 163.9 (C-4), 150.67 (C-2), 150.38 (d 3JCP = 9.1 Hz, C-ipso Ph), 139.74 (CH-6), 129.77 (CH-Ph), 129.47 (d, 3JPC=10.7 Hz, CHCH3P), 129.21 (d, 3JPC=14.7 Hz, NCH2CH=), 124.64 (CH-Ph),
120.68 (d, $^3J_{PC}$=4.5 Hz, CH-Ph), 111.00 (C-5), 74.71 (CH$_2$C(CH$_3$)$_3$), 49.73 (CHCH$_3$), 49.49 (CH$_2$N), 32.44 (d, $^3J_{PC}$= 127.2 Hz, CH$_2$P), 29.69 (C(CH$_3$)$_3$), 26.32 (C(CH$_3$)$_3$), 21.53 (d $^3J_{PC}$ = 6.3 Hz, CHCH$_3$), 10.87 (CH$_3$) ppm. $^{31}$P-NMR (202 MHz, CD$_3$OD) $\delta_P$ 29.23 ppm. HPLC: $\lambda$= 280 nm, F = 1 mL/min, t$_R$ = 16.06 min. (gradient from ACN/water 10:90 to 100% ACN in 30 minutes). MS(ESI+) $m/z$= 500.2 [M + Na$^+$] (100%).

Further elution with (DCM/MeOH 95:5 v/v) and preparative TLC (95:5 v/v) followed by preparative HPLC provided 14b (13.2 mg, 10% yield). R$_t$ (DCM/MeOH 95:5 v/v) = 0.29.

$^1$H-NMR (500 MHz, CD$_3$OD) $\delta_H$ 7.37 (1H, d, $J$=1.1 Hz, H-6), 7.35-7.32 (2H, m, C-5), 7.22-7.17 (3H, m, C$_6$H$_3$Ph), 5.79-5.76 (2H, m, NCH$_2$CH= and =C=CHCH$_2$P), 4.35 (2H, m, CH$_2$N), 3.91, 3.82 (2H, AB, $^4J_{AB}$ = 10.5 Hz, C$_2$H$_2$C(CH$_3$)$_3$), 3.67-3.60 (1H, m, CH$_2$CH$_3$), 2.86-2.80 (2H, m, CH$_2$P), 1.87 (3H, s, CH$_3$), 1.38 (3H, d, $J$= 7.2 Hz, CHC$_3$), 0.99 (9H, s, C(CH$_3$)$_3$) ppm. $^{31}$C-NMR (125 MHz, CDCl$_3$) $\delta_C$ 173.79 (d, $^3J_{PC}$=4.9 Hz, COO), 164.01 (C-5), 150.72 (C-2), 150.43 (d, $^3J_{CP}$ = 7.84 Hz, C-Ph), 139.66 (C-6), 129.77 (CH-Ph), 129.24 (d, $^3J_{CP}$ = 14.7 Hz, C$_6$H$_3$Ph), 125.16 (d, $^3J_{PC}$ = 11.0 Hz, NCH$_2$CH=), 124.86 (CH-Ph), 124.07 (d, $^3J_{PC}$ = 4.9 Hz, CH-Ph), 111.05 (C-5), 74.78 (CH$_2$C(CH$_3$)), 49.62 (CHCH$_3$), 49.23 (CH$_2$N), 32.79 (d, $^3J_{PC}$ = 130.8 Hz, CH$_3$), 29.70 (C(CH$_3$)$_3$), 29.36 (C(CH$_3$)$_3$), 21.79 (d, $^3J_{PC}$ = 2.5 Hz, CHCH$_3$), 12.30 (CH$_3$) ppm. $^{31}$P-NMR (202 MHz, CDCl$_3$) $\delta_P$ 28.51 ppm. HPLC: $\lambda$= 280 nm, F = 1 mL/min, t$_R$ = 16.14 min (gradient from ACN/water 10:90 to 100% ACN in 30 minutes). MS(ESI+) $m/z$= 500.2 [M + Na$^+$] (100%).

Further elution with a gradient DCM/MeOH (95:5 to 93:7 v/v) and preparative TLC (95:5 v/v) afforded 21 (34.9 mg, yield=25%). R$_t$ (DCM/MeOH 95:5 v/v) = 0.20. $^1$H-NMR (500 MHz, CD$_3$OD) $\delta_H$ 7.30 (1H, d, $J$= 1.2 Hz, H-6), 5.69-5.58 (2H, m, NCH$_2$CH= and =C=CHCH$_2$P), 4.38-4.28 (2H, m, CH$_2$N), 4.06-4.96 (2H, m, CHCH$_3$), 3.78, 3.76 (2H, AB, $J_{AB}$ = 10.5 Hz, CH$_2$C(CH$_3$)$_3$), 3.68, 3.65 (2H, AB, $J_{AB}$ = 10.5 Hz, CH$_2$C(CH$_3$)$_3$), 2.71-2.58 (2H, m, CH$_2$P), 1.78 (3H, d, $J$= 1.2 Hz, CH$_3$), 1.42 (3H, d, $J$= 7.0 Hz, CHCH$_3$), 1.40 (3H, d, $J$= 7.0 Hz, CHCH$_3$), 0.86 (9H, s, C(CH$_3$)$_3$) ppm. $^{31}$P-NMR (202 MHz, CDCl$_3$) $\delta_P$ 28.51 ppm. HPLC: $\lambda$= 280 nm, F = 1 mL/min, t$_R$ = 16.14 min (gradient from ACN/water 10:90 to 100% ACN in 30 minutes). MS(ESI+) $m/z$= 500.2 [M + Na$^+$] (100%).
(9H, s, C(CH₃)₃), 0.85 (9H, s, C(CH₃)₃) ppm. ¹³C-NMR (125 MHz, CD₃OD) δC 174.54 (d, ³JPC = 4.9 Hz, COO), 174.43 (d, ³JPC = 4.0 Hz, COO), 165.51 (C-4), 151.47 (C-2), 141.31 (CH-6), 128.67 (d, ²JPC = 13.0 Hz, =CH₂(CH₃)P), 125.29 (d, ³JPC = 10.2 Hz, NCH₂CH=), 110.03 (C-5), 74.03 (CH₂C(CH₃)₃), 73.96 (CH₂C(CH₃)₃), 48.85 (CH₃N), 48.80 (CH₃CH=), 48.50 (CH₃CH=), 32.93 (d, ¹JPC = 110.2 Hz, C(CH₃)₂P), 30.90 (C(CH₃)₃), 25.40 (C(CH₃)₃), 19.92 (d, ³JPC = 5.6 Hz, CH₂CH₃), 10.94 (C(CH₃)₃) ppm.

³¹P-NMR (202 MHz, CD₃OD) δP 27.35 ppm.

HPLC: λ = 280 nm, F = 1 mL/min, tᵣ = 17.59 min (gradient from ACN/water 10:90 to 100% ACN in 30 minutes). MS(ESI+) m/z = 543.3 [M + H⁺] (50%), m/z = 565.3 [M + Na⁺] (100%).

(2S)-neopentyl-2-(((E)-4-(5-methyl-2,4-dioxo-3,4-dihydropyrimidin-1(2H)-yl)but-2-en-1-yl)(naphthalen-1-yloxy)phosphoryl) amino)propanoate (15)

Compound 15 was prepared according to general procedure from 11 (216 mg, 0.752 mmol, 1 eq.) TMSBr (575.99 mg, 0.49 mL, 3.76 mmol, 5 eq.) (in dry ACN (10 mL), 1-naphthol (650.9 mg, 4.51 mmol, 6 eq.), L-alanine-O-neopentyl ester tosylate (249.39 mg, 0.752 mmol, 1 eq.), triphenylphosphine (262.3 mg, 4.51 mmol, 6 eq.) and 2-aldrithiol (994.6 mg, 4.51 mmol, 6 eq.). After workup, the crude was purified by silica chromatography column using a gradient of DCM/MeOH (99:1 to 95:5 v/v) and providing after preparative TLC (95:5 v/v) 15 (26 mg, 7% yield). Rₜ (DCM/MeOH 95:5 v/v) = 0.39. ¹H-NMR (500 MHz, CD₃OD) δH 8.02 (2H, d, ³J = 6.02 Hz, C₉H₈-Naph), 7.77 (1H, d, ³J = 6.02 Hz, C₉H₈-Naph), 7.76-7.21 (8H, m, C₉H₈-Naph), 7.58 (2H, dd, ³J = 6.0 Hz, CH-Naph), 7.58 (2H, dd, ³J = 8.0 Hz, CH-Naph), 7.43-7.21 (8H, m, CH-Naph), 7.21 (2H, m, H-6), 5.80-5.65 (4H, m, NCH₂CH= and =CHCH₂P), 4.23-4.17 (4H, m, CH₂N), 4.02-3.92 (2H, m, CHCH₃), 3.72, 3.58 (2H, AB, ³JAB = 10.5 Hz, CH₂C(CH₃)₃), 3.60, 3.56 (2H, AB, ³JAB = 10.5 Hz, CH₂C(CH₃)₃), 3.60, 3.56 (2H, AB, JAB = 10.5 Hz, CH₂C(CH₃)₃), 2.94-2.82 (4H, m, CH₂P), 1.65 (3H, d, ³J = 1.2 Hz, CH₃), 1.18 (3H, d, ³J = 6.8 Hz, CHCH₃), 1.10 (3H, d, ³J = 7.2 Hz, CHCH₃), 0.81 (9H, s, C(CH₃)₃), 0.76 (9H, s, C(CH₃)₃) ppm. ¹³C-NMR (125 MHz, CDCl₃) δC 174.02 (d, ³JPC = 4.2 Hz, COO), 173.57 (d, ³JPC = 4.8 Hz, COO), 165.41 (C-4), 165.39 (C-4), 151.44 (C-4), 151.35 (C-2), 146.45 (d, ²JPC = 9.3 Hz, C-ipso Naph), 146.31 (d, ²JPC = 9.3 Hz, C-ipso Naph), 141.12 (CH-
(2S)-benzyl-2-(((E)-4-(5-methyl-2,4-dioxo-3,4-dihydropyrimidin-1(2H)-yl)-but-2-en-1-yl)((5,6,7,8-tetrahydronaphthalen-1-yl)oxy)phosphoryl)amino)propanoate (16)

Compound 16 was prepared according to the general procedure, from 11 (116.30 mg, 0.45 mmol, 1 eq.), TMSBr (342.16 mg, 0.30 mL, 2.23 mmol, 5 eq.), dry ACN (5 mL) aldriothiol-2 (598.9 mg, 2.72 mmol, 6 eq.) 5,6,7,8-tetrahydro-1-naphthol (402.9 mg, 2.72 mmol, 6 eq.) L-alanine-O-benzyl ester tosylate (159.2 mg, 0.453 mmol, 1 eq.) and triphenylphosphine (713.1 mg, 2.72 mmol, 6 eq.). Then the mixture has been stirred for 5 hours at 50°C. After workup, the crude was purified by silica chromatography column using a gradient of DCM/MeOH (99:1 to 95:5 v/v) and providing after preparative TLC (95:5 v/v) followed by preparative HPLC 16 (21 mg, 8% yield). Rf (DCM/MeOH 95:5 v/v) = 0.25. 1H-NMR (500 MHz, CDCl3) δH 8.89 (1H, bs, NH), 7.33-7.22 (5H, m, C\text{H}-Ar), 7.10 (1H, d, J = 8.7 Hz, CH-TetrahydroNaph), 6.91 (1H, d, J = 1.0 Hz, H-6), 6.90 (1H, J = 8.7 Hz, CH-TetrahydroNaph), 6.76 (1H, J = 8.1 Hz, CH-TetrahydroNaph), 5.73-
5.42 (2H, m, NCH₂CH= and =CHCH₂P), 5.05-4.99 (2H, m, CH₂Ph), 4.18 (2H, t, J = 5.3 Hz, CH₂N), 4.02-3.94 (1H, m, CHCH₃), 2.69-2.64 (4H, m, CH₂-TetrahydroNaph and CH₂P), 2.56-2.52 (2H, m, CH₂-TetrahydroNaph), 1.80 (3H, s, CH₃), 1.67-1.66 (4H, m, CH₂-TetrahydroNaph), 1.25 (3H, d, J = 7.9 Hz, CHCH₃). ³¹C-NMR (125 MHz, CDCl₃) δc 173.62 (d, J = 5.9 Hz, COO), 164.14 (C=4), 150.80 (C=2), 148.75 (d, JPC = 8.8 Hz, C-ipso TetrahydroNaphOP), 139.59 (CH-6), 139.49 (C-ipso CH₂Ph), 135.23 (C-TetrahydroNaph), 129.16 (d, JPC = 13.7 Hz, =CHCH₂P), 128.65, 128.54, 128.22 (CH-Ar), 128.10 (d, JPC = 4.8 Hz, C-TetrahydroNaph), 125.92, 125.51 (CH-Ar), 125.26, (d, JPC = 10.97 Hz, NCH₂CH=) 116.83 (d, JPC = 3.3 Hz, CH-TetrahydroNaph), 110.02 (C-5), 67.25 (CH₂Ph), 49.69 (d, JPC = 4.3 Hz, CHCH₃), 49.20 (CH₂N), 32.91 (d, JPC = 129.6 Hz, CH₂P), 29.51 (CH₂-TetrahydroNaph), 23.72 (CH₂-TetrahydroNaph), 22.22 (2 x CH₂-TetrahydroNaph), 21.53 (d, JPC = 4 Hz, CHCH₃), 12.25 (CH₃) ppm. ³¹P-NMR (202 MHz, CDCl₃) δP 29.70, 29.19, ppm. HPLC: λ = 280 nm, F = 1 mL/min, tR = 17.90 min (gradient from ACN/water 10:90 to 100% ACN in 30 minutes). MS (ESI+) m/z = 574.2 [M + Na⁺] (100%).

(2S)-benzyl2-((((E)-4-(5-bromo-2,4-dioxo-3,4-dihydropyrimidin-1(2H)-yl)-but-2-en-1-yl)(phenoxy) phosphoryl)amino)propanoate (17a and 17b) and (2S)-benzyl-2-((((E)-4-(2,4-dioxo-3,4-dihydropyrimidin-1(2H)-yl)-but-2-en-1-yl)(phenoxy) phosphoryl)amino)propanoate (20a and 20b)

Compounds 17a, 17b, 20a and 20b were prepared according to the general procedure, from 12 (309.0 mg, 0.811 mmol, 1 eq.) TMSBr (620.6 mg, 4.05 mmol, 5 eq.) dry ACN (10 mL) Aldrithiol-2 (1.07 g, 4.86 mmol, 6 eq.) phenol (457.8 mg, 4.86 mmol, 6 eq.) L-alanine-O-benzyl ester tosylate (284.9 mg, 0.811 mmol, 1 eq.) of, triphenylphosphine (1.28 g, 4.86 mmol, 6 eq.) After workup, the crude was purified by silica chromatography column using a gradient of DCM/MeOH (99:1 to 95:5 v/v) and providing after preparative TLC (95:5 v/v) 17a (17 mg, 4% yield). Rf (DCM/MeOH 95:5 v/v) = 0.30. ¹H-NMR (500 MHz, CD₃OD) δH 7.97 (1H, s, H-6), 7.96 (1H, s, H-6), 7.39-7.29 (14H, m, CH-Ar), 7.20-7.15
Further elution with (DCM/MeOH 95:5 v/v) provided after preparative TLC (95:5 v/v) followed by preparative HPLC 17b (11.0 mg, 3% yield). Rf(DCM/MeOH 95:5 v/v) = 0.29. 

$^1$H-NMR (500 MHz, CD$_3$OD) $\delta$ 7.97 (1H, d, H-6), 7.38-7.30 (7H, m, CH-Ar), 7.21-7.15 (3H, m, CHPh), 5.81-5.69 (2H, m, NCH$_2$CH= and =CHCH$_3$), 5.09 (2H, s, CH$_2$Ph), 4.38-4.31 (2H, m, CH$_2$N), 4.06-4.00 (1H, m, CH$\equiv$CH$_3$), 2.86-2.75 (2H, m, CH$_3$P), 1.30 (3H, d, J = 6.9 Hz, CH$_2$P), 1.00-0.90 (3H, m, CH$_3$, CH$\equiv$CH$_3$) ppm.
