ABSTRACT:

This article develops conceptual and paradigmatic clarity in the circular economy literature from a management studies perspective.

This article uses a systematic literature review for analysing how circular economy is currently understood. It also reflects on how to establish paradigmatic anchoring of the circular economy in the management field.

Multiple definitions of the circular economy exist but they depict the circular economy narrowly and fail to incorporate aspects of competitiveness and profitability. Additionally, most of sustainability management research displays shortcomings in the way this literature frames the organisation-nature relationship.

This article aims to support conceptual and theoretical development in the circular economy literature and highlights opportunities for enhanced competitiveness and profitability deriving from circular business model innovation. However, further research is welcomed to assess this connection.

The conceptualisation of the circular economy proposed in this study emphasises aspects of competitiveness and profitability, which is of relevance to management practitioners.

CUST_SOCIAL_IMPLICATIONS_(LIMIT_100_WORDS): No data available.

This study addresses current shortcomings in how the circular economy is conceptualised. As a result, it proposes a more comprehensive conceptualisation which also includes competitiveness and profitability aspects and, thereby, is relevant from a management studies perspective. It also provides paradigmatic anchoring to the circular economy concept by suggesting that the Sustaincentric paradigm, which has received limited scholarly attention so far, is suitable to inform circular economy research and practice.

Circular Economy: Laying the Foundations for Conceptual and Theoretical Development in Management Studies

Abstract

Purpose
This article develops conceptual and paradigmatic clarity in the circular economy literature from a management studies perspective.

Research design
This article uses a systematic literature review for analysing how the circular economy concept is currently understood. It also reflects on how to establish paradigmatic anchoring of the circular economy in the management field.

Findings
Multiple definitions of the circular economy exist but they depict the circular economy narrowly and fail to incorporate aspects of competitiveness and profitability. Additionally, most of sustainability management research displays shortcomings in the way this literature frames the organisation-nature relationship.

Research limitations/implications
This article aims to support conceptual and theoretical development in the circular economy literature and highlights opportunities for enhanced competitiveness and profitability deriving from circular business model innovation. However, further research is welcomed to assess this connection.

Practical implications
The conceptualisation of the circular economy proposed in this study emphasises aspects of competitiveness and profitability, which is of relevance to management practitioners.

Originality
This study addresses current shortcomings in how the circular economy is conceptualised. As a result, it proposes a more comprehensive conceptualisation which also includes competitiveness and profitability aspects and, thereby, is relevant from a management studies perspective. It also provides paradigmatic anchoring to the circular economy concept by suggesting that the Sustaincentric paradigm, which has received limited scholarly attention so far, is suitable to inform circular economy research and practice.

**Keywords** - circular economy, circular competitiveness, economy-ecology reintegration, environmental paradigms, Sustaincentrism.

**Paper type** - Research paper

1. Introduction

The circular economy (CE hereafter), understood as an economy wherein value creation is decoupled from the consumption of finite resources (EMF et al., 2015), is becoming more and more relevant to corporate strategies (Mishra et al., 2019) since it “opens up opportunities for companies to build competitive advantage, create new profit pools, develop resilience and provide solutions to some of the most important issues facing business today” (PricewaterhouseCoopers, 2018: 1). Simultaneously, academic engagement with the CE has risen substantially in the last couple of years and with it the number of CE definitions proposed. Whilst the openness of the debate about how to define the CE is beneficial at the early stages of this emerging field, such a plurality of views brings some criticalities to advance conceptual development, theoretical building and practical implementation. In fact, the conceptual confusion surrounding the CE concept has been referred to as “circular economy babble” (Kirchherr et al., 2017: 228) leading to the conclusion that the CE is still a contested concept.
(Korhonen et al., 2018a) with the negative consequence that these discordant views may weaken its potential (Reike et al., 2018).

Yet despite the relative abundance of scholarly studies, the conceptual and theoretical foundations of the CE are only partially and insufficiently investigated (Bruel et al., 2018; Geissdoerfer et al., 2017). Furthermore, it is environmental and engineering sciences that have contributed the most to the CE literature in fields like Industrial Ecology compared to management studies (Lahti et al., 2018; Sehnem and Vazquez-Brust, 2018). Lahti et al. (2018) find that there is little engagement among management and organisations studies scholars with the CE: “the empirical evidence from research on the circular economy has not been analyzed or synthesized from a management or organizational theory perspective, which implies a limited focus on profitability and competitive advantage” (p. 2). On a similar line, Urbinati et al. (2017) underline that the CE and the strategic management fields have not cross-fertilised each other yet. As a result, this article asks: how can the CE be conceptualised to address current definitional shortcomings and advance its understanding from a management studies perspective?

Additionally, scholars have warned that knowledge production in management research has not been very effective in avoiding current sustainability failures (Zollo and Freeman, 2010). This demands a reflection on how the relation between organisations and their natural environment is framed, by investigating the ontological (related to the constituents of reality and their relationships) and epistemological (relating to knowledge production) assumptions underlying paradigms or worldviews to advance research and practice of corporate sustainability. In fact, Borland et al. (2016) have argued that current management literature it is not tightly linked with eco-centric thinking, i.e. with principles of ecological sustainability.
This is detrimental to the emergence of more radical, transformational corporate sustainability strategies which, in contrast, develop when assuming close interrelationship and responsibility towards nature and society (ibid.). Given both the relevance of addressing paradigmatic limitations in sustainability management research, and the inexistence of paradigmatic clarity in the CE field (Blomsma and Brennan, 2017), this article asks: how can CE paradigmatic anchoring in management studies be established?

By answering these two research questions this article contributes to build the much needed conceptual and paradigmatic clarity in the CE field, which is instrumental to both advancing the field intellectual tradition and thereby its conceptual and theoretical development, and practical implementation. This research also establishes a more direct academic engagement of management studies with the CE concept, which has been pretty limited to date. Furthermore, this article takes forward CE research along the line of argument suggested by Kumar et al. (2019) in this journal, who have argued that although a number of CE definitions have been proposed to date, “each of them seems to lack a few of the elements that would render them complete” (p. 1069).

The remaining parts of this article are organised as it follows. Next, the research method is described. Subsequently, CE thinking and principles, current conceptualisations and the alternative conceptualisation of CE that this article builds, are introduced. Then, the CE anchoring to environmental paradigms is discussed. The article concludes summarising contribution and suggesting future lines of enquiry.

2. Research Method
To answer to the first research question, this article uses a systematic literature review, a method enabling researchers to synthesise the state-of-art of research in a specific field (Adams et al., 2017; Denyer and Tranfield, 2009). Electronic database searches are among the most common strategies for sampling the relevant literature and they enable the collection of all the available evidence about a specific research topic (Tranfield et al., 2003). Although they are widely used, databases searches are not without challenges. These pertain to the choice of the databases, their different interfaces, search conventions and search limitations and so they point to the need to use alternative approaches (Wohlin, 2014). In contrast to exhaustive strategies - aiming at collecting all relevant studies - purposeful sampling strategies seek to find information-rich studies that provide useful insights and a deep understanding of the phenomenon under investigation (Hammerstrøm et al., 2017). Purposeful sampling strategies can be implemented through the use of the snowballing procedure (Hammerstrøm et al., 2017; Wohlin, 2014). Snowballing consists of identifying first relevant studies starting from key publications, and then other relevant publications are added to the sample including both those in the reference lists of the initial set of key publications (backward snowballing), and those citing these key publications (forward snowballing) (ibid.). Therefore, this article uses purposeful sampling strategy and the snowballing procedure to answer to the first research question. This methodological choice is also consistent with the research approaches followed in current CE literature (e.g., Blomsma and Brennan, 2017; Geissdoerfer et al., 2017).

A good starting point in snowballing is to identify an initial set of highly cited papers in the area of the systematic literature study (Wohlin, 2014). It follows the identification of further papers through backward and forward snowballing until no new papers are found; all the identified papers go in the data extraction stage (ibid.). To identify the initial set of relevant and influential papers, Google Scholar was used following Wohlin (2014), who suggests that it is appropriate in order to avoid bias in favour of any particular publisher. ‘Circular economy
concept’ was the search query used and the selection of relevant papers was limited to the time frame between 2010 and 2018, when CE-named studies started to appear and subsequently developing.

The study by Kirchherr et al. (2017), which collects a recent, systematic and comprehensive sample of CE definitions (n= 114), drawn from different sources, was identified as a highly cited paper (cited by 270 on the 5th of May, 2019). As the number of CE definitions in Kirchherr et al.’s study could be considered of a satisfactory size, given the recent development of CE literature, this study was used as a point of departure for the analysis of the CE definitions (the complete sample of these definitions can be downloaded as supplementary material accompanying Kirchherr et al.’s article at the publisher website). Excluding non-academic sources (n= 34), restricted the sample size (n= 80). A careful reading of the remaining CE definitions, revealed that: a) some of the proposed conceptualisations were cross-referencing existing conceptualisations; b) others linked the CE to its antecedents; c) and some others did not explicitly define the CE. For instance, Kirchherr et al. include in their sample Cullen’s (2017) definition which quotes the CE conceptualisation articulated by the Ellen MacArthur Foundation, one of the leading global institutions working to promote the CE, as: “a circular economy is one that is restorative and regenerative by design and aims to keep products, components, and materials at their highest utility and value at all times...” (EMF, 2015: 2). This result is also corroborated by Reike et al. (2018) who, in a critical review of the CE literature, maintain that “hardly any specific definitions [are] put forward” (p. 249) when it comes to how the CE is conceptualised. Consequently, explicitness and originality were added as inclusion criteria. By original CE definitions it is meant that even if they build on CE thinking and principles, they are articulated in a more novel manner rather than mostly drawing from existing conceptualisations. The adoption of these additional inclusion criteria further reduced the sample size (n= 9). By conducting some forward snowballing and including only
academic articles written in English, other two academic papers conceptualising the CE were identified, which increased the sample size (n=11). Moreover, other definitions of the CE found in academic studies subsequent to Kirchherr’s study were added (n=11). Overall, 22 definitions of the CE were chosen on the basis of the inclusion criteria and subjected to further analysis.

The papers included in the sample for data extraction respond to the criteria according to which a successful snowballing procedure is built: different research communities, publishers, years and authors are represented; they are identified on the basis of the research question, and given that academic research on the CE has only recently started proliferating (from 2016), the sample size is appropriate to reflect how the CE is approached and conceptualised (Wohlin, 2014). The selected conceptualisations of the CE are listed in alphabetical order in Table 1.

<INSERT TABLE 1 ABOUT HERE>

In order to appraise the definitions of the CE for the purpose of this research enquiry, it is important to offer an overview of CE thinking and principles. By comparing contemporary definitions of the CE with the principles underlying the CE and viewing the CE from a management perspective, limitations in current understandings are identified and hence the need for a new conceptualisation of the CE becomes clearer. This is accomplished in the next paragraph.

3. Circular Economy: Principles and Conceptualisation

CE thinking draws on different schools of thought in the economics, industrial ecology and sustainable business literature and its origins have been detailed.
CE principles and characteristics, derived from practitioners’ literature (EMF, 2015; EMF et al., 2015; EMF and McKinsey, 2012), are summarised as follows. *Foster system effectiveness*: the CE promotes the elimination of negative environmental externalities (pollution in its various forms) and the use of renewable energies and materials. *Diversity builds strength*: the resilience of living systems is guaranteed by biodiversity. Analogously, CE thinking appreciates and fosters diversity in economy to attain resilience and prosperity. *Waste is designed out*: by using materials in accordance with ‘biological’ and ‘technical’ cycles. Biological or renewable materials are conceived so that they can go back to the eco-system at the end of their useful life. Technical (synthetic or mineral) materials are designed to be used in multiple cycles of production and use through maintenance, repairing, refurbishing, remanufacturing and recycling, once materials quality is ensured. *Think in systems*: in a CE, system emphasis means to recognise that interdependencies occur among the many entities in our complex world but also that economic value should be generated alongside environmental and social value creating a virtuous development cycle. System thinking is evoked quite often in sustainability debates because it adopts a more holistic view, which is crucial for addressing the complexities of sustainability concerns (Vildåsen et al., 2017). *Optimise resources yields*: it involves maximising the value of resources over time in both technical and biological cycles. *Shift to renewable energy sources*: a CE is based only on renewable energies. *Think in cascades*: cascading biological materials across different applications before returning them to nature as nutrients, ensures that valuable feedstocks are recovered in different production processes. *Preserve and enhance natural capital*: only renewable energies and materials should be used whenever possible.
Table 1 grouped only the most explicit and original scholarly definitions of the CE selected in this study. However, some overlap still occurs across them. They also mostly give a narrow representation of the CE since they concentrate on the aspect of cycling materials and, hence, on end-of-life materials recovery strategies. Although this is pertinent since CE thinking, aiming at modelling the functioning of the economic system upon that of ecosystems, seeks to design out the concept of waste (EMF and McKinsey, 2012; 2013), few current definitions give attention to the broader CE characteristics and principles. CE principles also acknowledge: a) preserving and restoring natural capital; b) promote system effectiveness not just in material flows, and c) systems thinking and diversity (EMF, 2015; EMF et al., 2015).

In addition, the relevance of the implementation of CE principles within corporate strategies for better competitiveness and profitability has been clearly emphasised (e.g., EMF and McKinsey, 2012; Lacy and Rutqvist, 2015). In fact, new business models are highlighted as a critical building block for successful implementation of CE at scale and as a means through which create and capture value (EMF and McKinsey, 2012; EMF, 2015). Not only can circular business models reduce resource depletion and pollution but also be a source of competitive advantage via cost reductions, new revenue streams and better risk management (Jørgensen and Pedersen, 2018). Therefore, a ‘circular’ competitive advantage can be obtained by implementing innovative business models enhancing resource efficiency and customers’ value along the entire lifetime of a product (Lacy and Rutqvist, 2015). An even stronger argument in favour of the competitiveness angle of circular principles is made by Landrum (2018), who maintains that incorporating circularity in corporate strategies equals to the “blue ocean (Kim and Mauborgne, 2005) of sustainability strategy, an uncontested market space to be seized for competitive advantage” (Landrum, 2018: 304).
Business models can take varying forms in contributing to a CE (Lüdeke-Freund et al., 2019), though any attempt to categorise potential circular business models is simplistic as the real world is always more complex and distinctions may become blurred in practice. There are business models that find value from industrial symbiosis, where residuals from one production process become the input to another. They can occur within one company but may involve co-operating firms. British Sugar has turned waste streams and emissions from its core sugar business into valuable co-products (e.g., tomatoes, bioethanol, soil conditioner), realising new revenues streams and reducing costs, and consequently improving its competitive advantage and profitability (Short et al., 2014). Additionally, there are business models which can generate company value by increasing product durability and raising resource productivity through a cyclical process of resource reuse. Products can be reclaimed after use and materials re-used, and this is encouraged by retaining ownership and leasing or hiring out products under a service contract. Philips, the Dutch manufacturer of light bulbs, sells lighting services rather than light bulbs and it is a successful example of product-service systems in a CE. Philips selects and installs the most appropriate lighting equipment for its customers who are then charged on a pay per use model, which takes into account the hours of lighting services provided and the lighting capacity (Larsson, 2018). Resource productivity can be also enhanced by leveraging on the use of innovative and digital technologies to improve efficiency and product/process performances. WinSun, a Chinese construction company uses 3D-printing to build full-sized houses and apartments using 30-60% less material than in traditional construction (EMF et al., 2015). A Canadian company, Do It Right This Time (DIRTT), builds modules for the construction industry in a factory setting at a cost that is 50% below on-site construction (ibid.). Furthermore, recycling business models contribute to greater resource productivity. Interface, a leading manufacturer of carpet tiles, has joined the ‘Healthy Seas’ initiative: the nylon found in fishing nets abandoned in the ocean is recycled into new nylon
yarn that goes in the production of carpet tiles (Lacy and Rutqvist, 2015). Economic but also broader value (including ecological value) is produced.

Whilst the economic rationale of the CE thinking has been highlighted in some academic studies (see, for instance, Geissdoerfer et al., 2017), the scholarly definitions examined in this article, with the exception of Webster (2013), fail to incorporate aspects of competitiveness and profitability. This outcome can be viewed in the light of the fact that the academic literature on the CE suffers from both a limited management studies contribution (Lahti et al., 2018), and little investigation over how the CE could concretely offer opportunities for economic value creation at the company level (Ranta et al., 2018). This is an additional critical limitation of the CE definitions available to date. Based on these arguments, the following proposition about a more comprehensive definition of the CE is made:

**P₁:** the circular economy is a transformational and systemic vision for a more ecologically effective economic system that works within planetary limits, and thereby maintains and rebuilds natural capital. It is enabled by multiple, cooperative and simultaneous innovations at different scales in the wider socio-economic context involving regulation, policy and production and consumption systems. Companies in a circular economy can attain a sustained competitive advantage through innovative business models wherein circular principles in offerings and relationships enable the creation, delivery and capture of economic value, whilst ecological and social value are accrued by nature and society.

4. Circular Economy and Environmental Paradigms

The conceptualisation of the CE just proposed adds relevance to the CE concept from a strategic management perspective and management practice. Nonetheless, it demands management scholars to critically evaluate how CE underlying assumptions fit with
worldviews or environmental paradigms to establish paradigmatic anchoring, which is a precondition for theory building and development in the CE field. Notably, the conceptualisation of the CE presented here refers to the CE as… *a system that works within planetary limits*… This statement poses immediately ontological and epistemological questions pertaining to the relationship between organisations and their natural environment.

The necessity of the rethinking of organisational paradigms that it is evoked here was started by scholars in management and organisations studies in the 1990s, who questioned the suitability of organisational paradigms or worldviews for management research¹. Paradigms as famously put by Kuhn (1970) in *The Structure of Scientific Revolutions*, are “universally recognized scientific achievements that for a time provide model problems and solutions to a community of practitioners” (p. viii) and therefore, they “provide models from which spring particular coherent traditions of scientific research” (p. 10). Gladwin *et al.* (1995) warned that “modern management theory is constricted by a fractured epistemology, which separates humanity from nature (...). Reintegration is necessary if organizational science is to support ecologically and socially sustainable development” (p. 874).

These calls for reconsidering the foundations of much of management theory have not received enough attention, making very little inroads in mainstream management journals (Williams *et al.*, 2017; Winn and Pogutz, 2013). Consequently, academic research has not been very successful in driving corporate sustainability outcomes (Montiel and Delgado-Ceballos, 2014). Undoubtedly, more inclusive epistemological assumptions in management research are needed so that the natural environment becomes relevant in organisational processes and decision making (Hoffman and Ehrenfeld, 2015; Starik and Kanashiro, 2013). A worldview of nested systems - with the economy as a subsystem of ecology - is necessary as a prerequisite.
for guiding the implementation of strategies that are consistent with sustainable development (Spangenberg, 2015).

Taking into account the necessity of overcoming these limitations in management research and to answer to this article second research question, this research discusses Gladwin et al.’s (1995) call for reintegration of the ecological domain within modern management theory. In line with this, it is argued here that anchoring management research in *strong sustainability*, wherein organisations are viewed as embedded in their wider socio-ecological system with the consequence that their activities take place within ecological limits (Roome, 2012), is pertinent. *Strong sustainability*, which also resonate with the more recent concepts of *biophilic organisation* (Jones, 2016) and *bio-participation* (Skene, 2018) as a means to progress with corporate sustainability via reintegration of human systems within ecological systems, has yet to fertilise current business research and education (Landrum, 2018; Roome, 2012). Ignoring that organisations rely on the ecosystem for their survival, and that their actions have impact upon the ecosystem through feedback loops, is not beneficial to the development of a systemic sustainability management perspective (Williams et al., 2017).

This article maintains that Gladwin et al.’s (1995) environmental paradigm of Sustaincentrism, which mirror principles in *strong sustainability*, is suitable to establish paradigmatic anchoring of the CE in management studies. A formal definition of Sustaincentrism does not exist but scholars refer to its underlying principles (Valente, 2012). According to Gladwin et al. (1995) “for a worldview to be congruent with sustainable development it must manifest inclusiveness, connectivity, equity, prudence, and security” (p. 884). Principles in Sustaincentrism can be explained as it follows: *inclusiveness* (consideration is given to multiple systems, human, social, economic and environmental across time and space); *connectivity* (systems are interconnected and not isolated from each other, and
therefore, it is necessary to understand the impact that each has on the other); equity (fair
distribution of resources); prudence (human activities should take place within ecological
limits) and security (safety from persistent threats) (Gladwin et al., 1995; Montiel and Delgado-

Empirical evidence of the application of Sustaincentrism at the firm level is limited
(Valente, 2012). However, here it is argued that it can be appropriate to establish paradigmatic
anchoring with the CE. System thinking, which underlies Sustaincentrism, recognises the
interconnectedness existing between economic, ecological and social systems, and so it is very
useful to better frame the organisation and natural environment relationship and the
implications this has for companies activities (Williams et al., 2017). Systems thinking and the
wider Sustaincentrism principles are attuned to CE thinking, which is also consistent with a
strong sustainability view (Loiseau et al., 2016). Table 2 compares in details Sustaincentrism
principles with CE principles. It also illustrates the reasons why the connection between the
two sets of principles exists.

5. Conclusion and Implications for Theory and Practice

As an industrial model proposing to reintegrate economy within ecology, the CE has made
inroads into many public domains recently. However, the CE literature while growing
substantially, still lacks conceptual and paradigmatic clarity and limited is the contribution
from management studies.
Therefore, this article was constructed around two research questions: i) how can the CE be conceptualised to address current definitional shortcomings and advance its understanding from a management studies perspective? And, ii) how can CE paradigmatic anchoring in management studies be established? By critically evaluating CE definitions, principles and characteristics, this article brought to the attention competitiveness and systemic aspects pertaining to the CE, which are almost neglected in how the CE is conceptualised in scholarly literature. The contribution of this conceptualisation extends beyond current academic literature because this enquiry incorporates how the CE relates to competitiveness and profitability, which is of relevance to management practitioners.

The rise of the Anthropocene, a new geological epoch in which human impact on planet Earth has reached levels never met before modifying many of its eco-systems (Crutzen and Stoermer, 2000), poses substantial challenges for the future prosperity of humanity. Management scholars are not exempt from the intellectual task of identifying organisational frames and instruments that can encourage corporate strategies safeguarding rather than threatening planetary limits. The quest for management research that is more aligned to ecological thinking started in the 1990s but it has remained mostly unheard. Yet the scale of the ecological crisis and its consequences for sustaining production and consumption systems in the long term cannot be overlooked further. Ignoring physical materiality in the context of management research is no longer an option (Bansal and Knox-Hayes, 2013). As put by Whiteman et al. (2013), “it is time for corporate sustainability scholars to reconsider the ecological and systemic foundations for sustainability” (p. 307).

As a response to this challenge, this article has stressed the importance of establishing some paradigmatic anchoring of the CE concept and has identified in Sustaincentrism a suitable
environmental paradigm for this purpose. This step is crucial to provide some transparency in terms of philosophical assumptions, a precursor to guarantee scientific development in a particular field (Vildåsen et al., 2017). In fact, once paradigmatic clarity has been defined, theoretical building and development can take place. It is left to future enquiries the task to assess whether the most frequently used theories in the study of corporate sustainability are consistent with the principles in Sustaincentrism and CE thinking. In the Anthropocene, sustainable development is “development that meets the needs of the present while safeguarding Earth’s life-supporting system, on which the welfare of current and future generations depends” (Griggs et al., 2013: 306). Under these circumstances, businesses are required not simply to reduce their environmental impact but, more importantly, to transform the system within which they operate through innovative business models that produce environmental and social sustainability (Bolton and Hannon, 2016; Proka et al., 2018). Therefore, in addition to its academic relevance, Sustaincentrism in management research can be appropriate to inform current management practice and steer the emergence of innovative circular strategies.

To conclude, this article has opened up the way for more integration between CE and management literature. The relevance of this cross-fertilisation is going to grow significantly in the years ahead. Therefore, it is hoped that this article succeeds in encouraging complementary work between management studies and CE scholars.

6. Limitations and Future Research

Based on academic and practitioners’ literature, this article has emphasised opportunities for enhanced competitiveness and profitability deriving from circular business model innovation. However, this connection requires further research. The CE to date is far from reaching its full
potential and so some caution should be used in approaching the conceptualisation presented here. Future research could test the strength of the relationship existing between competitiveness and circular business models through detailed qualitative case studies, and thereby advancing the relatively little empirical evidence of successful circular cases (Hopkinson et al., 2018; Velenturf et al., 2019) and the limited research on circular business models (Lüdeke-Freund et al., 2019). Conceptual studies about circular business models would also be beneficial to aid conceptual development and practical implementation given that how they can be defined and implemented needs still attention (Urbinati et al., 2019). In addition to the study of the economic performances of circular corporate strategies, future studies could investigate the still contested aspect of the environmental benefits of end-of-life materials recovery strategies in a CE such as recycling (Helander et al., 2019; Olsen, 2019) and develop a set of indicators to assess progress towards the implementation of the CE (Howard et al., 2019) and the performances of the circular model on a macro scale (Mayer et al., 2019).
